

Exercise: Models using Foreign Keys

[Launch lab](#)

> Instructions

Goal

The learner will learn how to use the Foreign Key between two Models in Django.

Objectives

The learner will create a model called **DrinksCategory**

The learner will create a second model called **Drinks** to pass the argument for the foreign key in model attributes before performing migrations.

Introduction

The labs in this model will focus on the model part of the MVT pattern and in this lab, you will create two models and assign a one-to-many relationship using foreign keys.

Scenario

So far, the data model of the Little Lemon prototype uses single isolated models. However, you know that as requirements change, so does the complexity of the data model. For example, when describing a Menu, all the food items cannot fall under the same category. Instead, these items such as Desserts, Appetizers, and Entrée will each have their own categories.

Adrian has expressed an interest in creating a webpage that displays the drinks available at the restaurant in order of category.

Your task is to implement this request by making the necessary changes to the data model. You will need to create two new models to represent the **drinks** and **drinks category** tables. Additionally, these tables need to be linked in via a one-to-many relationship, because many drinks can belong to one category.

To implement this relationship, use your understanding of creating model relationships in Django, by implementing functionality that is similar to foreign keys in SQL.

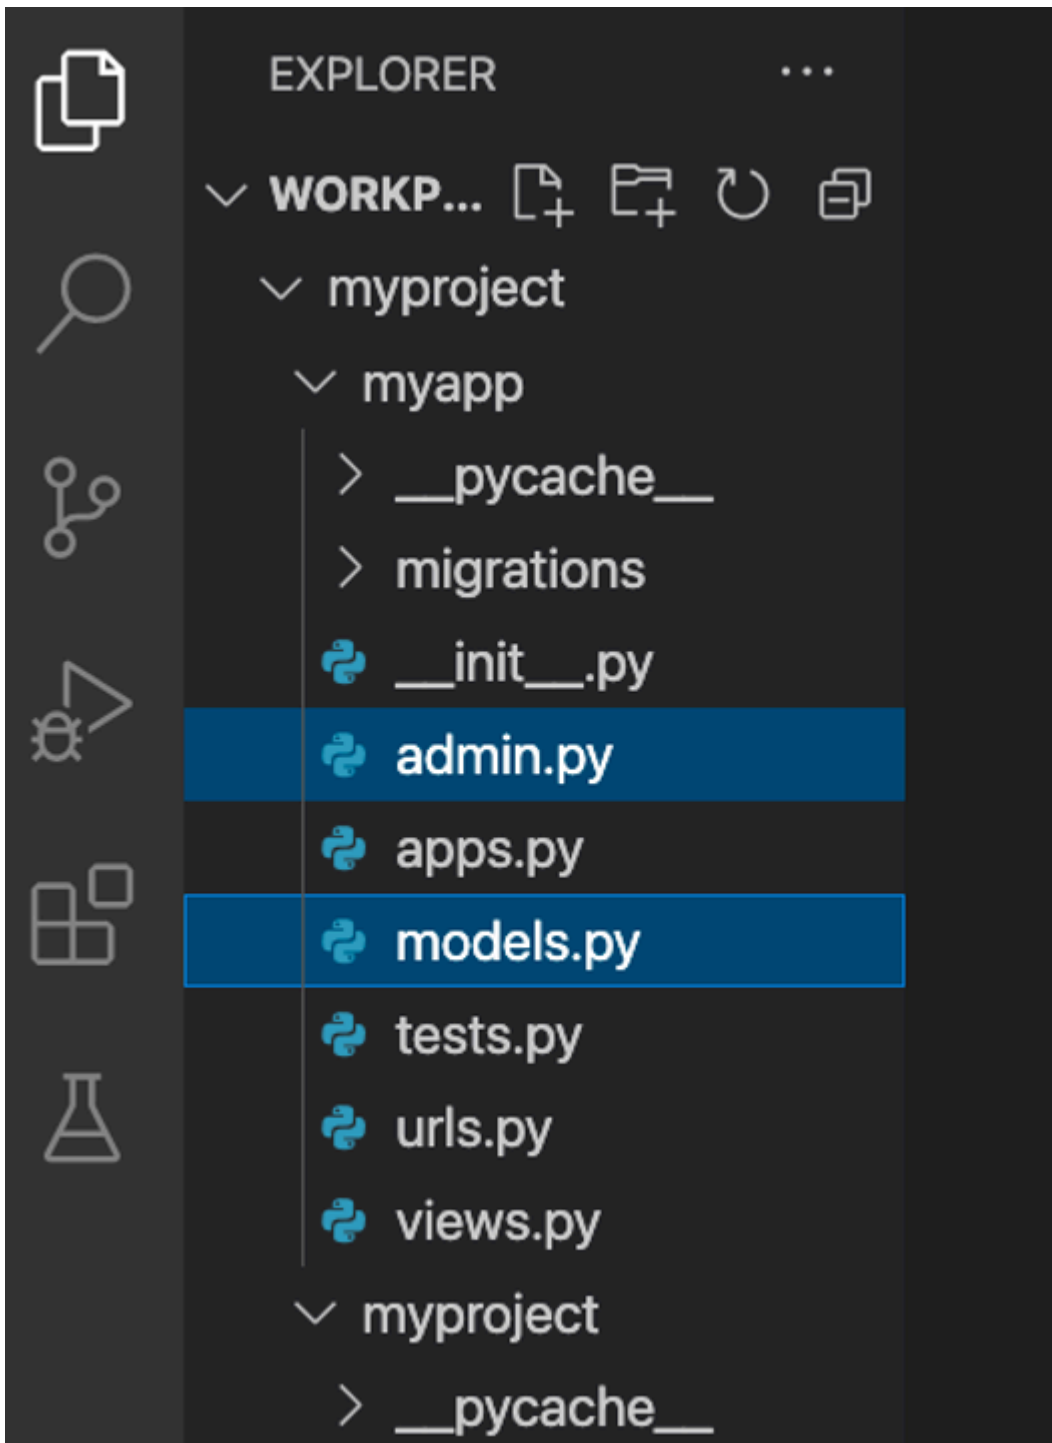

Learner Instructions

Initial Lab Instructions:

This lab will require you to modify the following files:

models.py

admin.py

Additionally, you are required to use the command line console inside the terminal of VS Code.

If it is not open already, go to **Terminal** on the Menu bar at the top of your screen and select **New Terminal**.

You have already built the project called **myproject** and added an app inside the project called **myapp**.

Note:

Follow the instructions below and ensure you check the output at every step and update the necessary files to create different views.

Steps

Step 1:

Expand the **myapp** folder from the explorer panel on the left and open the **models.py** file.

Step 2:

Create a class called **DrinksCategory** and pass **models.Model** to it as an argument.

Step 3:

Add the following attributes and pass their respective form field types and arguments.

Attribute	Form field type	Arguments
category_name	CharField	max_length = 200

Step 4:

Create another class called **Drinks** and pass **models.Model** to it as an argument.

Step 5:

Add the following attributes and pass their respective form field types and arguments.

Attribute	Form field type	Arguments
drink	CharField	max_length = 200
price	IntegerField	

Step 6:

Inside the class **Drinks**, create a third attribute called **category_id**, in addition to **drink** and **price**.

Assign it the value of **models.ForeignKey** and define the following arguments inside it:

The name of the first Model **DrinksCategory**

The argument **on_delete** with the value **models.PROTECT** assigned to it.

The argument **default** with a value equal to **None**

Step 7:

Go to the **admin.py** file under the project directory and register both models by passing them individually to the function **admin.site.register**.

Tip: Make sure you have imported both the models inside the **admin.py** file from **models.py**

Step 8:

In the terminal run the command to make migrations.

```
DjangoCourse$ python3 manage.py makemigrations
Migrations for 'myapp':
  myapp/migrations/0001_initial.py
    - Create model DrinkCategory
    - Create model Drink
DjangoCourse$
```

Step 9:

Run the command to perform the migrations.

Step 10:

Inside the explorer pane in the left panel of VS Code, Right click on the database **db.sqlite3** that is generated and select **Open Database**.

Step 11:

Go to **SQLITE EXPLORER** and click the arrow to expand it. Select **db.sqlite3** and scroll down to check if **myapp_drinks** and **myapp_drinkscategory** tables are generated.

Click on the **Play** button, or right-click and choose **Show Table**.

Note: If the table is empty, no results will be displayed.

Additional step: You can add entries to these tables with the help of commands you have learned using the Django shell or the Django admin panel.

You will learn how to use the Django admin panel later. For now let's add some database entries using the Django shell.

Step 12:

To enter inside the Django shell, run the following command in the terminal:

```
1 python manage.py shell
```

Once inside the Django shell, import the **DrinksCategory** model.

```
1 from myapp.models import DrinksCategory
```

Tip: To ensure you are inside the Django shell, make sure the symbols `>>>` are placed at the start of your commands.

Next, create a variable and instantiate it using keyword arguments to the model class:

```
1 cat = DrinksCategory(category_name='coffee')
```

Finally, use the **save()** method to save to the database.

```
1 cat.save()
```

In the **SQLITE EXPLORER**, locate the table **myapp_drinkscategory**, right-click and choose **show table**.

The screenshot shows the Coursera IDE interface. At the top, there's a navigation bar with 'coursera' logo, 'Navigate', 'Lab Files', and 'Help' buttons. Below this is a breadcrumb trail 'Home' and a path '/?folder=/home/coder/project' with a 'COPY' button and a 'Go' button. The main workspace is divided into several panels. On the left, the 'EXPLORER' panel shows a file tree with 'PROJECT' containing 'tests.py', 'urls.py', 'views.py', 'myproject' (which includes '__pycache__', '__init__.py', and 'asgi.py'), and 'OUTLINE' containing 'SQLITE EXPLORER'. The 'SQLITE EXPLORER' panel is expanded, showing a tree of database tables: 'django_content_type', 'django_migrations', 'django_session', 'myapp_drinks', and 'myapp_drinkscategory' (which is selected and highlighted). The 'myapp_drinkscategory' table is right-clicked, and a context menu is visible. The main editor area shows the 'SQLite' database selected, with a table view for 'myapp_drinkscategory' showing one row with 'id' 1 and 'category_name' 'coffee'. Below the table view, the 'TERMINAL' panel shows the Django shell prompt '>>>' followed by the command 'cat.save()'.

Step 13:

Now an entry is created in the **DrinksCategory** table, create a drink in the **Drinks** table that uses a foreign key from the **DrinksCategory** table.

Still in the Django shell, import the **DrinksCategory** model.

```
1 from myapp.models import DrinksCategory, Drinks
```

Create a variable **fk** to store the foreign key, and retrieve it using the **objects.get()** method.

```
1 fk = DrinksCategory.objects.get(pk=1)
```

Note: The **objects.get()** method retrieves the value from the **DrinksCategory** model.

Next, create another variable **Drink** and instantiate it using keyword arguments to the model class:

```
1 drink = Drinks(drink='mocha', price=7, category_id=fk)
```

Finally, use the **save()** method to save to the database.

```
1 drink.save()
```

In the **SQLITE EXPLORER**, locate the table **myapp_drinks**, right-click and choose **show table**.

The screenshot shows the Coursera lab interface. At the top, there's a navigation bar with 'Home', a file path '/?folder=/home/coder/project', a 'COPY' button, and a 'Go' button. Below this is the 'coursiera' logo. The main area is a dark-themed IDE. On the left, the 'EXPLORER' panel shows a project structure with files like 'apps.py', 'models.py', 'tests.py', 'urls.py', 'views.py', and a 'myproject' folder. Below that is the 'SQLITE EXPLORER' panel, which lists database tables: 'django_admin_log', 'django_content_type', 'django_migrations', 'django_session', 'myapp_drinks', and 'myapp_drinkscategory'. The 'myapp_drinks' table is selected. In the center, the 'SQL' panel shows a table with columns 'id', 'drink', 'price', and 'category_id_id'. The table contains one row: '1', 'mocha', '7', '1'. On the right, the 'TERMINAL' panel shows the command prompt with the command '>>> drink.save()' and a blank line below it. The bottom status bar shows 'sombwqqlabs.coursera.org', 'Python 3.8.10 64-bit', and 'Open Development Server'.

Concluding Thoughts

In this lab, you practiced creating a one-to-many relationship using models and foreign keys.
